EMERCOS ApS is a consultancy and software development company. We have many years experience with developing complex management solutions used for monitoring and provisioning in many industrial areas.

We are a small company and are able to keep the administrative cost down at its minimum. This makes us very competitive without drawback on the quality of our work.

We are specialized in consultancy and solutions based upon the Oracle database. We also deploy other databases such as Open-Source databases like mysql and hsqldb.

In EMERCOS ApS we have a long international experience with developing generic distributed management systems for monitoring and provisioning purposes. We have developed systems for particle accelerators, nuclear power plants, railway management, payphones management, telecom network management (TNM). Our experience is particularly extensive in the area of TNM and railway management. For the telecom industry we developed Network Management systems based on SNMP and TeMIP. We have worked several years in the railway software industry and have an in-house product for surveillance of train wheel data.

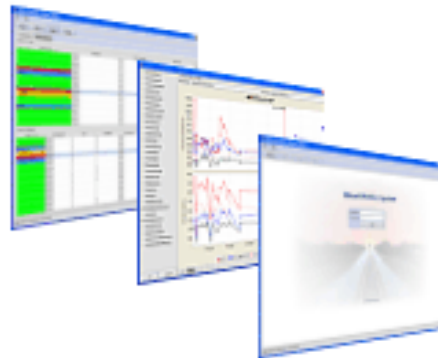

EMERCOS ApS offers consultancy services in the following areas:

- System development according to customer specifications
- Oracle DBA
- Project management with outsourcing to partners.

Consultancy services are typically offered as a fixed price project or at an hourly rate.

We are always happy to give a tentative price quotation free of charges.

Any outsourced development project will be implemented on the basis of an approved requirement specification, unless other has been agreed upon. In larger development projects we can make use of our partners, where we will focus on component and incremental development processes in the project. The project management, requirement specification, architectural design, test

specification and installation/training would be done by EMERCOS ApS in collaboration with the customer.

EMERCOS ApS develops internet/intranet solutions such as content management systems and portals. We also typically provide a web based UI in a client/server industrial management system. JBoss or Tomcat is mostly chosen for the middle-tier, and depending on the budget, Oracle, MacDB or MySQL database is used. Client software is mostly implemented in Java, jsp, struts or swing and a server solution is implemented in C++ under Unix/linux.
